

Production Working Hours Analysis

Business Problem:

Organizations need to understand whether employees are meeting planned working hours, where overtime is occurring, how much it costs, and which cities/divisions contribute most to workforce spending.

Approach:

I analyzed employee working-hour and compensation data using **Excel and Power BI**, transforming raw workforce records into an interactive productivity dashboard.

Key Analysis:

- Planned vs. actual working hours
- Shortfall and unworked hours
- Overtime hours and overtime cost
- Employee-wise earnings
- City-wise overtime earnings
- Division-wise workforce distribution
- Gender diversity
- Average hourly rate by job role
- Budget allocated vs. amount earned

Key Findings:

- Employees worked **368.1K hours** against **351.30K planned hours**.
- Total overtime reached **21.22K hours**, generating approximately **₹2.75M in overtime cost**.
- Total earnings were approximately **₹30.1M**, compared with an allocated budget of **₹28.78M**.
- Photography represents the largest work division, with approximately **264.96K worked hours**.
- Toronto and Tokyo show the highest city-level overtime earnings at approximately **₹539K each**.
- The dashboard shows gender distribution of **52.38% male and 47.62% female**.
- Average hourly rates shown are **₹86 for Cameraman, ₹78 for Coordinator, and ₹65 for Assistant**.

Business Story

The organization is working above planned capacity, but the additional workload is creating significant overtime costs. The dashboard helps management identify where those additional hours are occurring, which locations and employees are driving overtime, and how workforce costs are distributed across divisions and roles.
